

Business Analysis Chapter2

Across

4. User testing of the system is typically focused on validating the fitness for use of the system by intended users in a real or simulated operational environment.
6. testing focuses on interactions between components or systems
7. Which one of the iterative development models tends to be relatively short and the feature increments are correspondingly small, such as a few enhancements
9. Which of the 2 SDLC models describes the process as a linear flow of phases and one phase must begin when the other phase is complete ?
10. levels are groups of test activities that are organized and managed together

Down

1. The SDLC model describes how the activities in the software development project are related logically and
2. Which type of testing is usually done in isolation with the rest of the system?
3. The acceptance testing of the system by operations or systems administration staff is usually performed in a (simulated) production
5. Which testing focuses on the behavior and capabilities of a whole system or product?
8. What type of development occurs when a group of features are designed, built, and tested together in a series of cycles, often of a fixed duration?
