

CELL ORGANELLES

Across

3. Contains the DNA in a cell
5. Vesicles, vacuoles, and flattened sacs in the cytoplasm involved in intracellular secretion and transport
8. Helps in formation of lipids
10. Small, finger-like projections of the surface of an epithelial cell

11. They help in storage and release of substances as required by the cell

12. These contain centrioles that form spindles and helps separation of genetic material in cell division

Down

1. Helps in formation of proteins
2. The membrane network in cytoplasm that is composed of tubules

4. Enclosing the cytoplasm of a cell

6. Function is locomotion for a cell

7. Containing enzymes that digest particles and disintegrate the cell after its death

9. An organelle in cytoplasm of a cell that functions in energy production
