

Cell Organelles

Across

1. This is the name of the process that the chloroplasts in plant cells use to make energy from sunlight.
7. This is a network of passageways that proteins travel through to get to other parts of the cell. It does not have ribosomes.
11. This is a whip-like tail that helps a cell to move.
12. This is a round organelle that contains digestive enzymes that break down materials; it is the "garbage disposal" of the cell.
13. This is the name of the energy made by mitochondria.

14. This structure is only found in plant cells, and it provides extra rigidity and support to the outside of the cell.

15. This is a network of passageways that proteins travel through to get to other parts of the cell; it is covered with many ribosomes.

16. This is a large, round sac found in the cytoplasm that stores waste, water, food, or other materials.

Down

2. This organelle releases energy for the cell.
3. This organelle makes proteins for the cell.

4. This structure is only found in plant cells, and it converts energy from sunlight into sugars.

5. This word literally means "little organ". It is a part of the cell.

6. This is the fluid of the cell. It provides space for the cells to occupy and move through.

8. This both protects the cell and lets materials inside and outside of the cell.

9. This is the control center for the cell.

10. This organelle modifies and packages proteins.
