# Fish

## Across

**6.** Can weigh 1000kg or a ton which makes it the heaviest known bony fish in the world

**9.** 2. Their dinosaur-worthy scientific name, *Alepisaurus*, means "scaleless lizard."

**11.** Also known as St Pierre or Peter's fish.

**12.** Dubbed the 'Nutcracker' in S. America. Has molar-like teeth. Listed as an omnivore.

**13.** Absorbs nutrients through it's skin, produces litres of slime in minutes.

**14.** Common tinned food or bait for sea fishing. Has dark wavy stripes which are a 'schooling mark' to swim at the same speed as it's school.

## Down

**1.** No scales for first month of life. Found in UK. Have vomerine teeth. Not to be confused with their Rainbow friends.

**2.** Largest of the Anarhichadidae family, has a natural antifreeze in their blood and protruding fang-like canine teeth.

**3.** Also known as the Giant Devil Catfish

**4.** Longest bony fish in the ocean. They can reach a length of over 50 feet. Swims vertically.

**5.** Thought to be extinct until found in S. Africa in 1938.

**7.** Named after it's captor

**8.** The largest of the tunas and can live up to 40 years.

**10.** Common name: Pirarucu in Brazil, paiche in Peru.
