# Globe / Mapping Test

- |                                                                                                                                                                                                                          |                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| 1. shows the directions north, south, east, and west on most maps. May also show the intermediate directions or northeast, southeast, southwest, and northwest.                                                          | A. prime meridian |
| 2. used on maps to stand for things that are drawn on the map.                                                                                                                                                           | B. Compass Rose   |
| 3. where symbols on a map are explained                                                                                                                                                                                  | C. equator        |
| 4. used on maps as a tool for measuring distance, since mapmakers usually must draw things smaller than they really are                                                                                                  | D. Map Key        |
| 5. tells us what the map is about                                                                                                                                                                                        | E. sphere         |
| 6. tell us what things on the map are                                                                                                                                                                                    | F. Latitude       |
| 7. lines that run from west to east. They measure distances north and south of the equator. They are also called parallels                                                                                               | G. title          |
| 8. lines that run from north to south, pole to pole. They measure distances west and east of the prime meridian. Are also called meridians.                                                                              | H. scales         |
| 9. 0 degrees latitude, and it is an imaginary line that divides the earth into two halves, the northern hemisphere and the Southern Hemisphere. Is the longest latitude line.                                            | I. hemisphere     |
| 10. 0 degrees longitude. It is an imaginary line that passes through Greenwich, England. This and the 180 degree longitude line divides the earth into eastern and western hemispheres. The world time zones begin here. | J. labels         |
| 11. a globe or other ball shape                                                                                                                                                                                          | K. parallel lines |
| 12. half of a sphere                                                                                                                                                                                                     | L. Longitude      |
| 13. latitude lines that will never intersect                                                                                                                                                                             | M. Symbols        |
