

Landscapes and Land forms

Across

4. What is the gradual movement of the continents across the earth's surface through geological time
8. Specific shape or physical feature of the Earth's surface which has been produced by a natural process
9. Relating to or situated on a river or riverbank; riparian.
11. A biological community of interacting organisms and their physical environment
14. The rigid outer part of the earth, consisting of the crust and upper mantle
15. What is the dense central region of a planet, especially the nickel-iron inner part of the earth
16. Relating to the ideas, customs, and social behaviour of a society.
17. What is the southern half of the Pangaeon supercontinent that existed some 300 million years ago

19. What is the lithosphere of the earth is divided into a small number of plates which float on and travel independently over the mantle and much of the earth's seismic activity occurs at the boundaries of these plates

20. The outermost layer of rock of which a planet consists, especially the part of the earth above the mantle

Down

1. A tectonic boundary where two plates are moving toward each other
2. the region of the earth's interior between the crust and the core, believed to consist of hot, dense silicate rocks
3. An extended break in a rock formation, marked by the relative displacement and discontinuity of strata on either side of a particular plane

5. What is a waterless, desolate area of land with little or no vegetation, typically one covered with sand.

6. A strike-slip fault occurring at the boundary between two plates of the earth's crust

7. What is the landform formed by tectonic plates on the surface of the land?

10. Mountains that form mainly by the effects of folding on layers within the upper part of the Earth's crust

12. What is formed when easily dissolvable bedrock (the rock below the surface of the land, such as limestone) is worn away by slightly acidic water from an underground source or a source on the Earth's surface.

13. Of or near a coast

18. A linear feature that exists between two tectonic plates that are moving away from each other
