Neonatal Assessment Terminology

Across

5. A bluish discoloration of the hands and feet due to sluggish peripheral circulation

9. AKA a "soft spot"

12. A flat area of capillary dilation appearing as small clusters of pink-red spots on nose, nape of neck, lower occipital bone, and eyelids that blanch easily (stork bites)

15. Folds of tissue over scrotum that allow for expansion of the tissue

16. fine downy hair covering the body that is normally seen on shoulders

17. This assessment rules out congenital hip instability. A positive sign is palpable dislocation.

Down

1. A "newborn rash" characterized by red, elevated papules appearing around 24-48 hours after birth

2. A procedure to rule out congenital hip dislocation; a positive sign is a "click"

3. White, pinpoint papules on chin and/or nose resulting from unopened sebaceous glands

4. A collection of fluid in the soft tissues of the scalp that may override the suture lines and resolves within 24-48 hours

6. A hematoma that is limited to the suture lines and visually develops of parietal bones

7. Discoloration of skin in irregular areas resembling a lace-like pattern

8. Small, white, round epithelial cysts on hard palate and along gum margins

10. A white cheese-like substance covering the body and noticeable in creases of the skin

11. An area of bluish-black pigmentation over buttocks and lower back often seen in non-Caucasian races

13. Gap between abdominal recti muscles

14. Shaping of the head caused by overriding of cranial bones to facilitate movement through birth canal
