Phylum Artropoda

Across

- **2.** Sac like organs that extract waste from blood
- **4.** Chewing mouthparts of a crustacean
- **5.** Used for air to enter/leave a terrestrial arthropod's breathing tubes
- 12. Mouthparts of a chelicerate
- **13.** Used to transport blood throughout an arthropod's body
- **14.** This system controls the process of molting
- **15.** Crustacean with five pairs of legs

- **18.** More than 2000 separate lenses that detect motion and colour
- **20.** Land arthropods have this to prevent water loss

Down

- **1.** The fusion of the head and thorax
- **3.** Used for respiration in aquatic arthropods
- **6.** All spiders produce this
- 7. Does not grow as the animal grows and is made up of a protein and carbohydrate

- **8.** The protein and carbohydrate that makes an exoskeleton
- **9.** Flipperlike appendages used for swimming
- **10.** This controls and coordinates the muscle groups
- **11.** During the molting process, it leaves an animal
- **16.** Nerve cells along the ventral cord
- **17.** Process of which the exoskeleton is shed while a new one is produced
- **19.** The only type of fertilization terrestrial arthropods are able to do
