

# Science 1

**Across**

- 2. the prevailing weather condition in a certain region over a long period of time
- 7. process by which rocks are broken down into smaller pieces without any change to their makeup
- 10. the force that attracts everything towards the center of the earth
- 11. tool used to measure barometric pressure

- 12. winds that travel long distances and continuously blow in the same direction
- 13. the movement of rocks and weathered material downhill by gravity

**Down**

- 1. the process by which the minerals in the rocks change
- 3. landforms formed by receding glaciers
- 4. streams of water within a sea or ocean
- 5. a measure of how far a location is from Earth's equator
- 6. valleys, canyons, and plains
- 8. a material that does not allow thermal energy to pass through it easily
- 9. a vertical stream at the edge of a river or stream
