

# Skeletol System By:Andrea Rivera

## Across

- 1.** the socket of the hipbone, into which the head of the femur fits
- 5.** the body of an arthropod between the head and the abdomen
- 8.** bone extending from the shoulder to the elbow
- 9.** tough elastic tissue, mostly converted to bone in adults
- 11.** an internal or external framework of bone, cartilage, or other rigid material supporting or containing the body of an animal or plant
- 12.** a series of vertebrae extending from the skull to the small of the back, enclosing the spinal cord and providing support for the thorax and abdomen; the backbone.

- 13.** a structure in the human or animal body at which two parts of the skeleton are fitted together
- 14.** each of the series of small bones forming the backbone, having several projections for articulation and muscle attachment, and a hole through which the spinal cord passes.
- 15.** a framework of bone or cartilage enclosing the brain of a vertebrate; the skeleton of a person's or animal's head.

## Down

- 2.** a denser material used to create much of the hard structure of the skeleton
- 3.** any of the pieces of hard whitish tissue making up the skeleton in humans and other vertebrates.

- 4.** a rigid external covering for the body in some invertebrate animals, especially arthropods, providing both support and protection
- 6.** each of a series of slender curved bones articulated in pairs to the spine (twelve pairs in humans), protecting the thoracic cavity and its organs.
- 7.** a soft fatty substance in the cavities of bones, in which blood cells are produced
- 10.** an internal skeleton, such as the bony or cartilaginous skeleton of vertebrates
