# Thyroid Gland Matching

- |  |                                  |
|--|----------------------------------|
| 1. What is secreted by parafollicular C cells and regulates calcium homeostasis? | A. Subclinical Hyperthyroidism   |
| 2. Occurs in 6.4 % of adult women and 1.5% of adult men                          | B. Thyroid Gland                 |
| 3. Drug associated with the Wolff- Chaikoff Effect                               | C. Palpitations/ anxiety         |
| 4. Peripheral tissues have excess thyroid hormone                                | D. Calcitonin                    |
| 5. Common cause of hypothyroidism  | E. Cold intolerance/weight gain  |
| 6. Protein synthesized and secreted exclusively by follicular cells              | F. Hashimoto's Thyroiditis       |
| 7. Synthesized by neurons in the hypothalamus                                    | G. Thyroglobulin                 |
| 8. What is the thyroid gland primarily made up of?                               | H. Thyroid nodules               |
| 9. Main functions is to produce thyroid hormone and calcitonin                   | I. Hypothyroidism                |
| 10. TSH is low, but free T4 is normal  | J. Amiodarone                    |
| 11. Low free T4 along with normal or high TSH                                    | K. Thyrotropin Releasing Hormone |
| 12. 15% of people acquire this through familial disposition                      | L. Thyrotoxicosis                |
| 13. Symptoms of hypothyroidism   | M. Iodine                        |
| 14. Symptoms of thyrotoxicosis   | N. Grave's Disease               |
