

# When Your Child Has Trouble Walking

## Across

6. Some symptoms of this condition include low muscle tone, difficulties with basic gross motor skills, trouble with fine motor skills, and delayed self-care skills
7. Serve an antigravity function and appear in line with the motor skills they support
8. Children with this condition have tight muscles, overactive reflexes, and trouble coordinating movement
9. What some children with Cerebral Palsy may need to use
10. A child is considered delayed in walking if she has not taken her first steps by this age

## Down

1. Actions of the central nervous system that are present at birth and are exhibited by typically developing infants; gradually give way to voluntary motor skills
2. One cause of Cerebral Palsy
3. The sequence of actions that involve muscle activation and movement; they allow people to move their bodies
4. The first person a concerned parent should contact
5. This describes half of the children born with Cerebral Palsy
